# Making tidy easier

Data Wrangling, Session 8

Kieran Healy

**Code Horizons** 

October 2, 2024

## Making it easier to be tidy

### Load the packages, as always

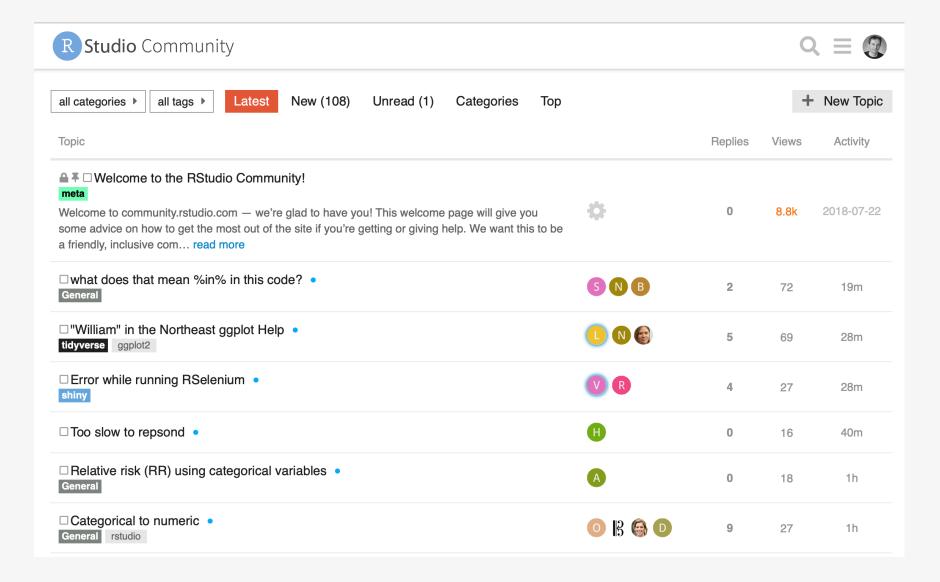

```
library(here) # manage file paths
library(socviz) # data and some useful functions
library(tidyverse) # your friend and mine
library(haven) # for Stata, SAS, and SPSS files

library(broom) # tidy model summaries
```

# Moving ahead

# Some helpful things

#### The RStudio Community

#### The reprex package

**HELP ME HELP Y** 

Reference

Articles ▼

News .

#### Overview

Prepare reprexes for posting to GitHub issues, StackOverflow, in Slack messages or snippets, or even to paste into PowerPoint or Keynote slides. What is a reprex? It's a **repr**oducible **ex**ample, as coined by Romain Francois.

Given R code on the clipboard, selected in RStudio, as an expression (quoted or not), or in a file ...

- runit via rmarkdown::render(),
- with deliberate choices re: render() arguments, knitr options, and Pandoc options.

Get resulting runnable code + output as

- Markdown, suitable for GitHub or Stack Overflow or Slack, or as
- R code, augmented with commented output, or as
- Plain HTML or (experimental) Rich Text

The result is returned invisibly, written to a file and, if possible, placed on the clipboard. Preview an HTML version in RStudio viewer or default browser.

#### Installation

Download from CRAN at

https://cloud.r-project.org/

package=reprex

#### The usethis package

usethis 2.0.1.9000

Setup

Reference

Articles ▼

News ▼

Search...

#### usethis

usethis is a workflow package: it automates repetitive tasks that arise during project setup and development, both for R packages and non-package projects.

#### Installation

Install the released version of usethis from CRAN:

install.packages("usethis")

Or install the development version from GitHub with:

```
# install.packages("devtools")
devtools::install github("r-lib/usethis")
```

#### Usage

Most use \*() functions operate on the active project: literally, a directory on your computer. If you've just used usethis to create a new package or project, that will be the active project. Otherwise, usethis verifies that current working directory is or is below a valid project directory and that becomes the active project. Use proj\_get() or proj\_sitrep() to manually query the project and read more in the docs.

A few usethis functions have no strong connections to projects and will expect you to provide a path.

#### Tables, tables, tables

The **gtsummary** package is very powerful. There are a number of other very good tidy table-making options too.

```
library(gtsummary)
trial
# A tibble: 200 × 8
          age marker stage grade response death ttdeath
  trt
  <chr> <dbl> <dbl> <fct> <fct> <int> <int>
                                            <dbl>
1 Drug A
        23 0.16 T1
                                             24
                        II
        9 1.11 T2
2 Drug B
                                             24
3 Drug A 31 0.277 T1
                                             24
                       ΙI
4 Drug A NA 2.07 T3
                                   1 1 17.6
                       III
5 Drug A
          51 2.77 T4
                       III
                                        1 16.4
        39 0.613 T4
                                      1 15.6
6 Drug B
7 Drug A 37 0.354 T1
                        ΙI
                                        0 24
                                   0 1 18.4
8 Drug A
          32 1.74 T1
9 Drug A 31 0.144 T1
                        II
                                             24
10 Drug B
          34 0.205 T3
                                             10.5
# i 190 more rows
```

The **gtsummary** package is very powerful. There are a number of other very good tidy table-making options too.

```
trial D
  tbl_summary(
   include = c(age, grade, response),
  by = trt, # split table by group
  missing = "no" # don't list missing data separately
) D
  add_n() D # add column with total number of non-missing observations
  add_p()
```

Characteristic	N	<b>Drug A</b> N = 98 <sup>7</sup>	<b>Drug B</b> N = 102 <sup>1</sup>	p-value
Age	189	46 (37, 60)	48 (39, 56)	
Grade	200			
1		35 (36%)	33 (32%)	
II		32 (33%)	36 (35%)	
III		31 (32%)	33 (32%)	
Tumor Response	193	28 (29%)	33 (34%)	
<sup>1</sup> Median (Q1, Q3); n (%)	)			

### Tables, tables, tables

gtsummary() straight out of the box:

```
gss_sm D
  select(race, degree, marital) D
  drop_na() D
  tbl_summary(
    by = race, # split table by group
    missing = "no" # don't list missing data separately
) D
  bold_labels()
```

Characteristic	<b>White</b> N = 2,096 <sup>1</sup>	<b>Black</b> N = 487 <sup>1</sup>	<b>Other</b> N = 276 <sup>1</sup>
degree			
Lt High School	197 (9.4%)	60 (12%)	71 (26%)
High School	1,057 (50%)	292 (60%)	112 (41%)
Junior College	166 (7.9%)	33 (6.8%)	17 (6.2%)
Bachelor	426 (20%)	71 (15%)	39 (14%)
Graduate	250 (12%)	31 (6.4%)	37 (13%)
marital			
Married	979 (47%)	121 (25%)	110 (40%)
Widowed	196 (9.4%)	35 (7.2%)	18 (6.5%)
Divorced	363 (17%)	93 (19%)	39 (14%)
Separated	55 (2.6%)	27 (5.5%)	20 (7.2%)
Never Married	503 (24%)	211 (43%)	89 (32%)
<sup>1</sup> n (%)			

With a bit more work ...

Characteristic	<b>Drug A</b> N = 98	<b>Drug B</b> N = 102
Age		
N Non-missing	91	98
Mean (SD)	47 (15)	47 (14)
Median (Q1, Q3)	46 (37, 60)	48 (39, 56)
Min, Max	6, 78	9, 83
Marker Level (ng/mL)		
N Non-missing	92	98
Mean (SD)	1.02 (0.89)	0.82 (0.83)
Median (Q1, Q3)	0.84 (0.23, 1.60)	0.52 (0.18, 1.21)
Min, Max	0.00, 3.87	0.01, 3.64

Similar to earlier, but simpler:

### For example, manually

[1] TRUE

Imagine how you might build up a set of tests and checks
But you don't have to manage this manually

#### Use testthat to check things

### Use testthat to check things

#### testthat in practice

Oriented towards package development

Consider packaging your datasets! Benefits to documentation/codebooks etc

One-table example: uscenpops

More extensive: covdata

How R packages work: Wickham & Bryan

### Summarizing your wrangling with skimr

We might want to make a codebook of our data

library(skimr)

#### Summarize with skimr

We might want to make a codebook of our data

```
library(skimr)
organdata ← read_csv(here("data", "organdonation.csv"))
```

### Summarize with skimr
